Pork trade flows

Global Meat Demand by Protein

Global Annual Renewable Freshwater Availability (2.5 minute)

Sources: ISciences, LLC (processing & visualization); University of New Hampshire & Global Runoff Data Center (annual freshwater runoff); Center for International Earth Science Information Network, Columbia University (population); United States Geological Survey (water sheds, rivers), Geoscience Australia (Australian watersheds); ESRI, Inc. (national and state/province boundaries).

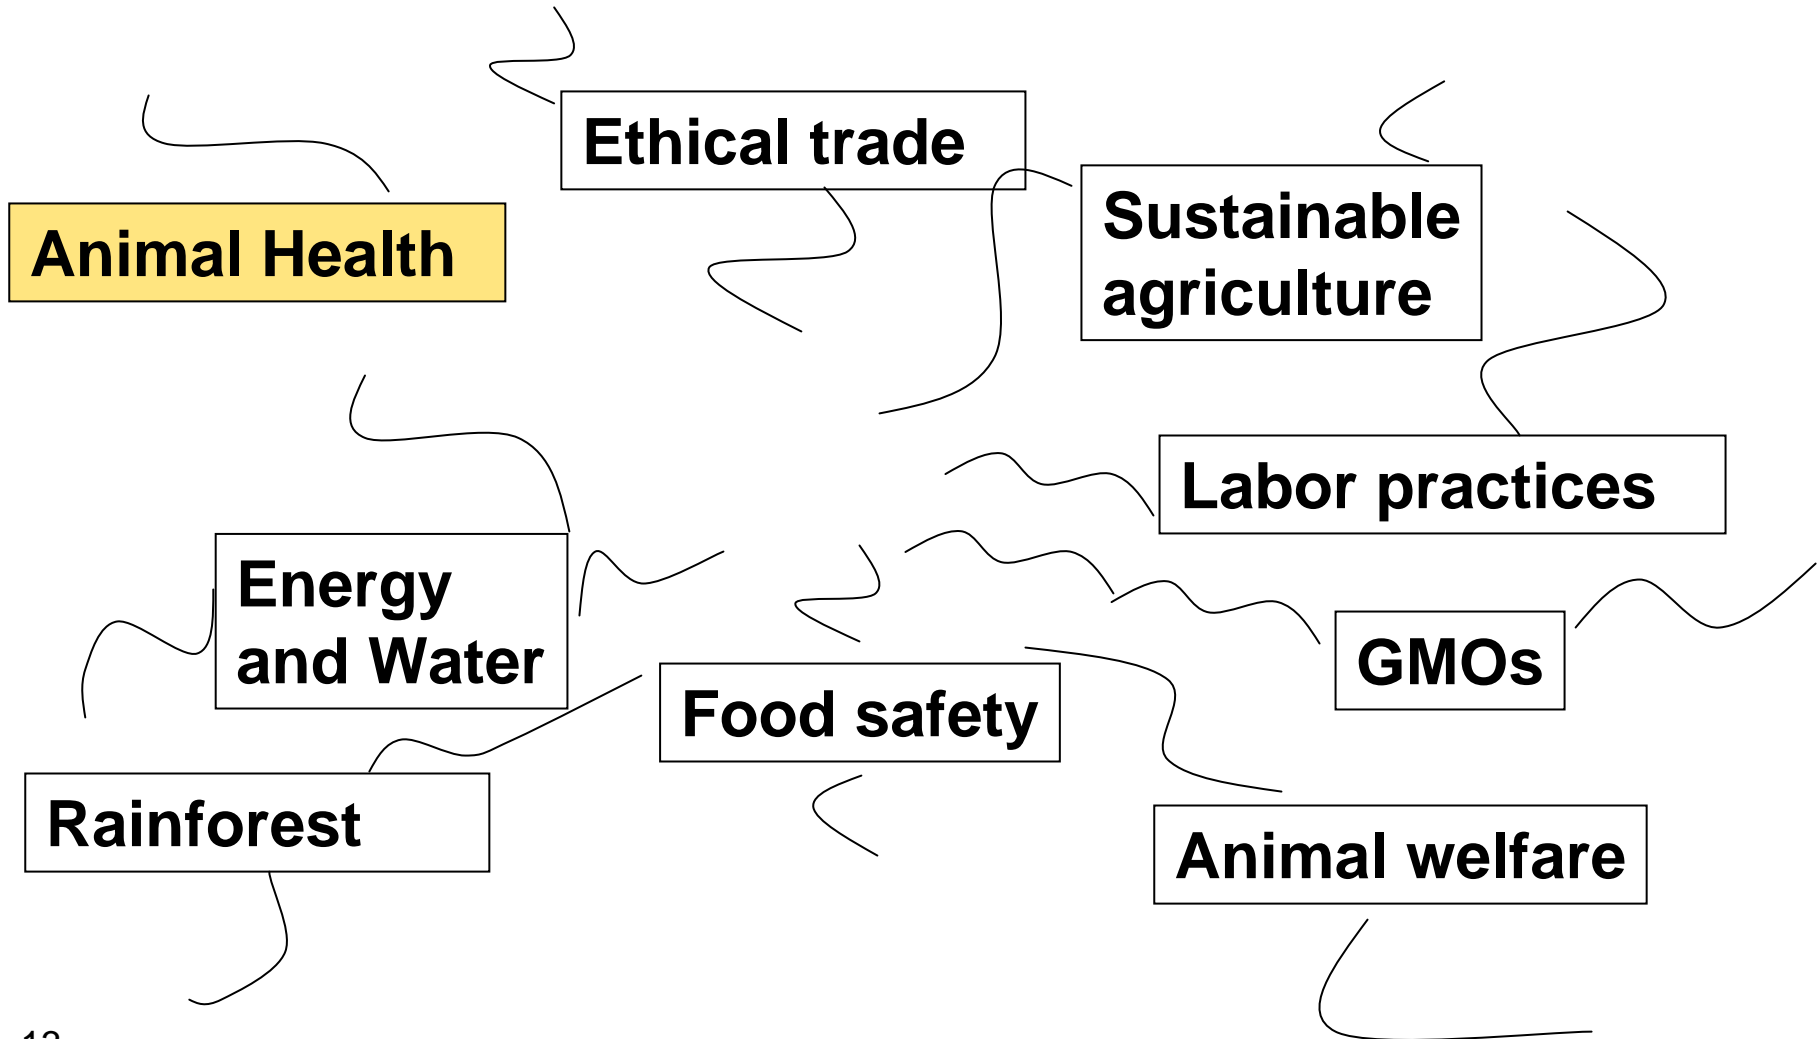

Benefits of a Global Food System

- Produce in optimal regions
 - Resources, Labor, Water, Soil
- Balance annual and seasonal production variations
- Optimize value of “parts”
- Stimulates global economic development
- Increased variety of food for global consumers

Complex Global Food System Issues

The Wakeup Call

H5N1

Aftosa

BSE

Animal Diseases

- Disrupt lives, societies and supply chains
- Impact consumer confidence
- Inflict huge economic damages
- Are increasing in frequency and severity

70% of known pathogens are zoonotic

- Food-borne, environmental and direct animal contact
- Virus evolution into new strains (ex: pandemic)

Some Observations

- Disparity in animal and public health capacity undercuts global disease control
- Failure to recognize the global public good of animal and public health systems
- National self-interests often trump global needs
- Failure to implement science-based trade standards needed to optimize global food systems
- Lack of integration between the animal, human and wildlife/environmental health communities
- Resistance to technology limits solutions
- Lack of sustainable models for animal health services in the developing world

A New Reality?

- Not all diseases can be eradicated globally
- Diseases do not always respect borders
- Most diseases do not require complete trade suspension to prevent, control, eradicate
- Prevention and risk management are more effective than a crisis response

Governments alone can not effectively manage risk

Role for Public Private Partnerships

Opportunities

- Public-Private Partnerships
- Implementation of international standards
- Veterinary Services capacity building
- Adopt tools to limit supply-chain disruption
 - Compartmentalized animal production
 - Geographic Zoning where appropriate
- Leadership Development
- New VS models for the developing world
